### Fuel Drainage Services Made Safe and Easy

AutoDrain is a name that has become synonymous with the End of Life Vehicles industry, both in France and in the UK. Their specially developed depollution equipment is widely recognised for its benefits in both cost and safety, earning them the reputation as leaders in their field.

Further building on their existing product range, AutoDrain have now invested their knowledge and expertise into the development of two innovative recovery units for processing misfueling incidents. These new products offer a fantastic business opportunity for operators within the recovery sector; with little financial investment, operators could cut out the middle-man by cleaning up misfuelings in their own workshops or by the road-side, saving money on outsourcing to local garages.

The Fuel Recovery Unit and Mobile Scavenger combine the need for cost-effective misfueling solutions, while satisfying industry health and safety objectives. These units meet with all legal requirements and come with substantial fuel-holding capacity. With fittings available to enable connectivity to any vehicle, these unique vessels offer the most cost-effective, labour-efficient and safe solution within the recovery service.
